

100 Days of Azure DevOps

Day 18 Handout — Import, mirror push & history verification

Learning in public · Personal lab only · Educational content · Not a sales pitch

Architecture A — migration methods

Method	How it works	Best when
Import UI	Azure Repos clones from a source Git URL	Simple migrations, public or PAT-backed sources
Bare + mirror	git clone --bare then git push --mirror	You need every ref and full control

Architecture B — what moves vs what you rebuild

Category	Migrates with Git	Must reconfigure separately
History	Commits, authors, dates	—
Refs	Branches and tags	Default branch setting in Azure Repos
Automation	—	CI secrets, service connections, webhooks
Collaboration	—	PR discussions, host-specific apps
Security	History may include old secrets	Scan + rotate before widening access

One-liner to remember

Migration moves history · Hygiene decides whether that history is an asset or a liability

Step-by-step lab (20–30 min)

In project **azure-100-labs**:

- 1 Create empty repo **imported-sample** (or use Import repository)
- 2 Import a small public GitHub repo **or** bare-clone + **git push --mirror**
- 3 Clone the Azure Repos copy locally
- 4 Verify: **git log --oneline -n 10**, branches, and tags
- 5 Confirm default branch is **main**
- 6 Write **docs/repo-migration-checklist.md** in azure-100-labs

Mirror commands

```
git clone --bare https://github.com/<user>/<repo>.git
cd <repo>.git
git push --mirror https://dev.azure.com/<org>/azure-100-labs/_git/imported-sample
```

Done checklist

- imported-sample exists in Azure Repos
- Pre-migration commits visible in git log
- Default branch verified as main
- Migration checklist documented

Tomorrow — Day 19

Repo security — branch policies that protect main after the move.
