

100 Days of Azure DevOps

Day 21 Handout — CI as code, not as a wizard

Learning in public · Personal lab only · Educational content · Not a sales pitch

Architecture A — what a pipeline is

Piece	Role	Day 21 lab
YAML in Git	The contract — reviewed with the code	azure-pipelines.yml
Agent pool	Who executes the job	Microsoft-hosted ubuntu-latest
Run + logs	The receipt you can audit	One echo step, open the log

Architecture B — YAML vs Classic

Style	Where it lives	Risk
YAML	In the repo, in the PR	You must learn YAML — drift is visible
Classic	In the service UI	Convenient; config can drift outside Git

One-liner to remember

Pipelines are not robots that replace engineers · They are the contract that stops you from being the robot

Step-by-step lab (20–30 min)

In project **azure-100-labs**:

- 1 Pipelines → New pipeline → Azure Repos Git → this repo
- 2 Commit **azure-pipelines.yml** (trigger main, ubuntu-latest, echo Hello)
- 3 Run once and confirm the hosted image in the job log
- 4 Write **docs/pipelines-day21.md** (YAML vs Classic for this repo)

Starter YAML

```
trigger:
  - main
pool:
  vmImage: ubuntu-latest
steps:
  - script: echo Hello from Day 21
    displayName: Hello
```

Done checklist

- Pipeline run succeeded
- YAML lives in Git
- docs/pipelines-day21.md written

Tomorrow — Day 22

Microsoft-hosted vs self-hosted agents.
