

100 Days of Azure DevOps

Day 4 Handout — CALMS is the habit. DORA is the receipt.

1 - Azure & DevOps Foundations · Personal lab only · Educational content · Not a sales pitch

Architecture A — CALMS as a delivery system, not a poster

Letter	What it looks like in Azure DevOps	Red flag
Culture	Blameless notes in work items / PR comments	First question is 'who deployed?'
Automation	YAML pipeline on every main push (Phase 3)	Click-ops at midnight in Portal
Lean	Small PRs, WIP limit on Boards Doing column	Big-bang Friday release branch
Measurement	DORA four keys tracked weekly, even roughly	Only metric is ticket count
Sharing	docs/ in the repo + PR templates (Phase 2)	One person knows the release ritual
Not CALMS	Buying Azure DevOps seats with no pipeline	The sticker on the laptop

Architecture B — DORA four keys (decide what you will actually count)

Metric	Question	Personal-lab proxy
Deployment frequency	How often do we ship to an env?	Green pipeline runs to main per week
Lead time for changes	Commit SHA → production how long?	git log time → pipeline finish time
Change failure rate	What % of releases need a hotfix?	Reverts / failed releases / 'hotfix/' PRs
Time to restore (MTTR)	How fast do we recover?	Minutes from red pipeline to green on main
Elite vs theatre	Daily deploys with tiny PRs	Monthly release + 40% rollback is not elite
Agile vs DevOps	Agile plans the work; DevOps ships it	Standup without a pipeline is not DevOps

Architecture C — pitfalls that turn metrics into vanity

Pitfall	What you see	Fix
Deploy count without quality	50 deploys, 20 hotfixes	Pair frequency with change failure rate
Lead time = coding time	Ignores PR wait + pipeline queue	Measure commit to main merge to env
MTTR = mean time to first reply	Slack 'looking' is not restore	Clock until the failing check is green
CALMS as a job title	Hire a 'DevOps engineer' to click Portal	Team owns YAML, Boards, and the pager
No baseline	Cannot say if Phase 3 CI helped	Write today's 1-5 scorecard in the repo
Tool worship	Azure DevOps org with zero pipelines	DORA cares about outcomes, not hub count

One-liner to remember**DevOps is not a job title with a laptop sticker — CALMS + DORA tell you if the sticker is lying.****Step-by-step lab (personal Azure / Azure DevOps only)**

No Azure spend today. Personal notes in the repo you will create on Day 6 (or a local markdown file until then).

- 1 Create a local folder ~/azure-100-notes (or C:\labs\azure-100-notes). No work laptop policy files.

- 2 Write docs/calms-dora-day04.md with a 1-5 score for Culture, Automation, Lean, Measurement, Sharing — last team or yourself, honestly.
- 3 Circle the weakest letter. Write three sentences: the habit you will build in this 100-day series.
- 4 Pick ONE DORA metric you can measure later (even 'pipeline runs on main per week'). Write the definition of done.
- 5 Skim the Four Keys article (Google Cloud blog on DORA). Copy the four names into the markdown — no employer data.
- 6 Optional: git init the notes folder locally so Day 11 has something real to commit. Do not push to a work remote.

Personal CALMS / DORA scorecard (commit this markdown later)

```
# docs/calms-dora-day04.md
# CALMS (1-5, honest)
# Culture: _
# Automation: _
# Lean: _
# Measurement: _
# Sharing: _
# Weakest letter: _
# DORA metric I will track: deployment_frequency | lead_time | change_failure_rate | time_to_restore
# Proxy in this lab: count of green runs on main / week after Day 21
# Baseline date: 2026-09-19
```

Done checklist

- Can recite CALMS without a slide
- Can name the four DORA metrics in order
- Filled a 1-5 scorecard and picked one metric to track
- No Azure resources created today (cost = 0)

Tomorrow — Day 5

Azure DevOps Services overview
