

100 Days of Azure DevOps

Day 5 Handout — Five hubs pretending to be one product — plan, store, ship, prove, package

1 - Azure & DevOps Foundations · Personal lab only · Educational content · Not a sales pitch

Architecture A — idea to package (same work item ID if you wire it)

Step	Hub	Artifact you should see
1 Plan	Boards	User Story / Bug with State, Area, Iteration
2 Store	Repos	Git commit SHA on refs/heads/main
3 Review	Repos PRs	PR linked to work item via AB#id
4 Ship	Pipelines	YAML run: jobs, steps, logs, artifacts
5 Prove	Test Plans	Test case + run result Pass/Fail/Blocked
6 Package	Artifacts	Feed views @local / @prerelease / @release
Identity	Microsoft Entra ID / MSA	Personal Microsoft account on the org

Architecture B — Azure DevOps vs GitHub (pick by constraint)

Constraint	Azure DevOps	GitHub
Work items + TFVC history	Boards + optional TFVC (you stay on Git)	Issues; no TFVC
YAML CI + Classic	Pipelines YAML + Classic editor still exists	GitHub Actions YAML only
Private packages	Azure Artifacts (NuGet/npm/Maven/Python/UPack)	GitHub Packages
Manual test cases	Test Plans (SKU-dependent)	Not a first-class test-case product
Enterprise process	Agile / Scrum / CMMI process templates	Projects + issues; lighter process
This series	Personal org + project azure-100-labs	Optional public mirror later — not required

Architecture C — pitfalls that split the five hubs into five silos

Pitfall	What you see	Fix
Boards with no repo link	Stories never mention a SHA	Link commits/PRs with AB#<id>
Repo with no pipeline	main is 'done' when someone copies ZIP	Day 21: azure-pipelines.yml on main
Tests only in Slack	'Looks good' with no Test Plans or CI test task	Manual cases in Test Plans; unit tests in YAML
DLL in email	No feed, no version, no restore	Artifacts feed (Day 9) + nuget.config / .npmrc
Work org by accident	dev.azure.com/employer-...	Create a NEW personal org; never screenshot work
Public project too soon	Lab secrets in wiki	Create private project day05-overview

One-liner to remember

Boards plan, Repos store, Pipelines ship, Test Plans prove, Artifacts package — five apps, one org.

Step-by-step lab (personal Azure / Azure DevOps only)

Personal org at <https://dev.azure.com> only. Name it something like yourname-100days. No employer org.

- 1 <https://dev.azure.com> → create organization (personal Microsoft account). Skip any work-directory invite.
- 2 New project → Name day05-overview → Visibility Private → Process Agile → Create.
- 3 Left nav → Boards → Work items → New User Story 'Touch all five hubs'. Save.
- 4 Repos → Files → Initialize with a README. Note the clone URL
https://dev.azure.com/<org>/day05-overview/_git/day05-overview
- 5 Pipelines → Create Pipeline → Azure Repos Git → select the repo → inspect the YAML starter. Cancel without saving if you want Day 21 to be the first YAML.
- 6 Test Plans hub → open once (enable trial if prompted). Artifacts → open once. Do not post screenshots of emails or tenant names.
- 7 Bookmark <https://dev.azure.com/<org>/day05-overview>. Tomorrow you create the long-lived project azure-100-labs.

Hub map (bookmark) — optional Azure DevOps CLI later

```
# https://dev.azure.com/<your-org>/day05-overview
# Hubs: Overview | Boards | Repos | Pipelines | Test Plans | Artifacts
# Optional after Day 6:
# az extension add --name azure-devops
# az devops configure --defaults organization=https://dev.azure.com/<your-org> project=day05-overview
# az boards work-item show --id <id> -o table
```

Done checklist

- Can name all five hubs and what each produces
- Personal org exists; project day05-overview is private Agile
- Opened Boards, Repos, Pipelines, Test Plans, Artifacts once
- No work org screenshots, no employer users invited

Tomorrow — Day 6

Setting up an Azure DevOps organization
