

100 Days of Azure DevOps

Day 9 Handout — The pantry. Pipelines cook. Without a feed you re-buy flour every build.

1 - Azure & DevOps Foundations · Personal lab only · Educational content · Not a sales pitch

Architecture A — feed, views, upstreams (same package id, different promotion)

Piece	What it is	Lab setting
Feed	Private registry scoped to org or project	day09-packages, project-scoped
Upstream nuget.org	Proxy + cache of public NuGet	Enable on create
Upstream npmjs	Proxy + cache of public npm	Enable on create
View @local	Default: every push lands here	Do not skip; this is the inbox
View @prerelease / @release	Promotion without changing the version	Use in Phase 3, not today
Retention	Max versions / days to keep	Leave default; 2 GB free tier is enough
Identity	Feed permissions: Feed Readers / Contributors	You = Owner; invite nobody

Architecture B — client config by ecosystem (Phase 3 will consume this URL)

Ecosystem	Config key / file	Publish command later
NuGet / .NET	nuget.config packageSources	dotnet nuget push --source <feed>
npm / Node	.npmrc registry= + always-auth=true	npm publish (with PAT/oauth)
Python	pip index-url / .pypirc	twine upload --repository-url
Maven	pom.xml repository + settings.xml	mvn deploy
Universal Packages	az artifacts universal	az artifacts universal publish
Pipeline restore	NuGetCommand@2 / npm authenticate	Never paste a PAT into YAML

Architecture C — pitfalls that republish secrets or miss the cache

Pitfall	What you see	Fix
Org-scoped feed by accident	Every project sees lab packages	Create as project-scoped to azure-100-labs
No upstream	CI fails when nuget.org blips; also slower	Include packages from common public sources
PAT in nuget.config committed	Secret in git log	Credential Provider / pipeline env; .gitignore nuget.config with keys
Emailing nupkgs	MyLib_final_v2.zip	That is the problem Artifacts exists to kill
@release without promotion	Consumers see every local push	Promote package version to @release in the UI
Empty feed panic	0 packages today	Fine — URL in notes is the deliverable

One-liner to remember

Artifacts are the pantry — Pipelines cook dinner; without a feed you keep re-buying the same flour every build.

Step-by-step lab (personal Azure / Azure DevOps only)

Project azure-100-labs. Create an empty project-scoped feed. Do not publish secrets. Personal org only.

- 1 azure-100-labs → Artifacts → Create Feed.
- 2 Name day09-packages. Scope: Project azure-100-labs (not organization). Visibility: members of this project.
- 3 Check Include packages from common public sources (nuget.org, npmjs). Create.
- 4 Feed settings → Views. Note @local, @prerelease, @release. Do not delete them.
- 5 Connect to feed → NuGet → copy the packageSources URL. Paste into notes/artifacts-day09.md locally.
- 6 Connect to feed → npm → copy the registry= https://pkgs.dev.azure.com/.../npm/registry/ line.
- 7 Permissions tab: you are Owner. Do not add work users. Empty package list is success for today.

nuget.config + .npmrc pointing at the project feed (no PAT in Git)

```
<?xml version="1.0" encoding="utf-8"?>
<configuration>
  <packageSources>
    <clear />
    <add key="day09-packages" value="https://pkgs.dev.azure.com/<org>/azure-100-labs/_packaging/day09-packages/
nuget/v3/index.json" />
  </packageSources>
</configuration>

# .npmrc (project)
# registry=https://pkgs.dev.azure.com/<org>/azure-100-labs/_packaging/day09-packages/npm/registry/
# always-auth=true
```

Done checklist

- Can explain feed vs upstream vs view (@local/@release)
- day09-packages exists, project-scoped, upstreams on
- Feed URL saved in notes (NuGet and/or npm)
- No PAT, password, or nupkg committed

Tomorrow — Day 10

Mini project + recap
