

100 Days of Azure DevOps

Day 13 Handout — Default branch, folder contract, .gitignore — stop future archaeology

2 - Azure Repos & Git Mastery · Personal lab only · Educational content · Not a sales pitch

Architecture A — repo layout (paths pipelines will look for)

Path	Owns	Later consumer
/src	Application code	Day 24 SampleApi, Day 25 sample-node
/docs	ADRs, notes	Branching ADR, CALMS scorecard
/pipelines	YAML entrypoints	dotnet-ci.yml, node-ci.yml
/infra	Bicep/ARM later	Empty .gitkeep is enough today
/notes	Daily markdown	day11.md already
/.gitignore	What never becomes a blob	bin/, node_modules/, .env
README.md	How we use Git here (Day 20)	Clone instructions, no secrets

Architecture B — default branch + remote settings

Setting	Default for labs	Change it when
Default branch	main	Legacy master still sitting there — rename
Clone URL	https://dev.azure.com/<org>/azure-100-labs/_git/azure-100-labs	SSH if you already have keys
Repo name vs project	Can match project or not	Multiple repos: name by product, not 'code'
README / gitignore on create	Initialize with README	Empty repo blocks some pipeline UIs
File size	Keep under Azure Repos blob limits; no ISOs	Git LFS only if you truly need binaries
Policies	Overview today; enforce Day 19	Do not skip policies because 'solo'

Architecture C — pitfalls that pollute the object database

Pitfall	What you see	Fix
Commit node_modules	10k files, unreviewable PR	.gitignore + git rm -r --cached node_modules
.env in history	PAT sitting in a blob forever	gitignore now; rotate the PAT; filter-repo later if needed
Default still master	Pipelines trigger: main never fires	Repos → Branches → Change default to main
Windows bin/Debug	dlls in every PR	VisualStudio gitignore template
Root junk	random.pdf, Desktop.ini	Folders: src docs pipelines infra
Second remote named work	git push ships lab notes to employer	git remote remove work

One-liner to remember

A messy repo root is a messy brain — /src /docs /pipelines /infra saves future-you from archaeology.

Step-by-step lab (personal Azure / Azure DevOps only)

Personal azure-100-labs. Set main as default. Add folder contract + .gitignore. No work remotes.

- 1 Repos → Branches. If default is master: ... → Set as default branch on main. Update any local: git switch main.
- 2 git switch -c feature/day13-repo-layout
- 3 Create folders src, docs, pipelines, infra with .gitkeep files so Git tracks empty dirs.
- 4 Add a .gitignore (Node + .NET + Python combined is fine). Must include node_modules/, bin/, obj/, .env, *.user.
- 5 git add src docs pipelines infra .gitignore && git commit -m "chore: repo layout and gitignore" && git push -u origin feature/day13-repo-layout
- 6 Open PR to main (or merge if policies are still off). Confirm default branch is main after merge.
- 7 Project settings → Repositories → azure-100-labs → Overview. Note default branch = main. Policies come Day 19.

.gitignore for this lab (Node, .NET, Python, secrets)

```
node_modules/  
dist/  
bin/  
obj/  
*.user  
*.suo  
.env  
.env.*  
!.env.example  
__pycache__/  
.venv/  
*.log  
.DS_Store  
Thumbs.db
```

Done checklist

- Default branch is main
- src, docs, pipelines, infra exist on the branch/main
- .gitignore blocks node_modules, bin/obj, .env
- origin is still the personal Azure Repos URL

Tomorrow — Day 14

Pull requests & code review
