

100 Days of Azure DevOps

Day 32 Handout — PaaS comfort food: Microsoft.Web/serverfarms + sites, zip deploy, then delete the kitchen if it costs

4 - Continuous Delivery · Personal lab only · Educational content · Not a sales pitch

Architecture A — App Service pieces the task actually hits

Resource	Type / SKU	Pipeline hook
Plan	Microsoft.Web/serverfarms sku F1 (Free)	Always-on off; unloads. Fine for hello
Web app	Microsoft.Web/sites kind app	appName in AzureWebApp@1
Bits	zip / folder from artifact drop	package: \$(Pipeline.Workspace)/**/*.zip
Identity	ARM service connection (azureSubscription)	Robot badge. Not Owner on the subscription
Runtime	linuxFxVersion or windows stack	Must match what CI published (dotnet/node/python)

Architecture B — App Service vs what you will do tomorrow

Need	App Service (today)	Functions (Day 33)
Shape of work	HTTP site that stays a site	Event: HTTP, timer, queue — scale to zero
Host	Plan + site; you pick F1/B1/S1	Consumption Y1 vs Premium EP1 vs dedicated plan
CD task	AzureWebApp@1 / @2	AzureFunctionApp@2 appType: functionApp
Slots later	Standard S1+ (F1 has none)	Premium/Dedicated; not the F1 story

Architecture C — pitfalls that succeed and deploy nothing useful

Pitfall	What you see	Fix
Glob miss	AzureWebApp@1 green; default page still there	Match the zip CI published; list \$(Pipeline.Workspace)
Wrong stack	You do not have permission / module not found	linuxFxVersion matches runtime; do not mix win/linux zips
Owner SPN	It works, and the robot can delete the sub	Scope the service connection to rg-day32-lab
Orphan plan	RG gone, plan leftover billing	Delete the RG (plan lives in the RG). Tonight if cost-sensitive

One-liner to remember

App Service is PaaS comfort food — less drama than VMs, still enough knobs to burn dinner if the zip glob is wrong.

Step-by-step lab (personal Azure / Azure DevOps only)

Personal Azure subscription + personal Azure DevOps org. Project azure-100-labs. Resource group rg-day32-lab. Delete tonight if you do not need it for slots later this week.

- 1 az login on the personal account. az group create -n rg-day32-lab -l centralindia (or your nearest region).
- 2 Create a Free F1 Linux plan + webapp with a globally unique name (starter CLI). Do not use a work subscription.
- 3 Project Settings → Service connections → Azure Resource Manager → scoped to rg-day32-lab (or the subscription if you must). Name it azure-100-sc.
- 4 Wire AzureWebApp@1 to azure-100-sc, appName, and the drop zip from CI. Run once. Hit <https://<app>.azurewebsites.net>.

- 5 If the site is still the default page, the glob missed. List files on the agent; fix package; rerun. Do not rebuild in the deploy job.
- 6 Cost-sensitive: az group delete -n rg-day32-lab --yes --no-wait. Slots (Day 34) need Standard — recreate then, not on F1.

CLI + AzureWebApp@1 — F1 hello, zip from drop

```
# personal Cloud Shell / local CLI
az group create -n rg-day32-lab -l centralindia
az appservice plan create -g rg-day32-lab -n plan-day32 --sku F1 --is-linux
az webapp create -g rg-day32-lab -p plan-day32 -n app-day32-<unique> --runtime "NODE:20-lts"

# pipelines/deploy-appservice.yml (deploy job steps)
- task: AzureWebApp@1
  inputs:
    azureSubscription: azure-100-sc
    appName: app-day32-<unique>
    package: $(Pipeline.Workspace)/ci/drop/**/*.*.zip
```

Done checklist

- Personal RG + F1 webapp deployed from the pipeline zip
- Service connection is not a story about subscription Owner
- No rebuild in the deploy job
- RG deleted or a written reason to keep it until Day 34

Tomorrow — Day 33

Deploy to Azure Functions — Consumption vs Premium, AzureFunctionApp@2, still a zip from CI.
