

100 Days of Azure DevOps

Day 33 Handout — Event-shaped work, a plan that can sleep, and a different CD task — still not a Visual Studio publish as source of truth

4 - Continuous Delivery · Personal lab only · Educational content · Not a sales pitch

Architecture A — Function App vs App Service (same control plane, different product)

Dimension	Function App	App Service web app
Resource	Microsoft.Web/sites kind functionapp	kind app (Day 32)
Unit of work	Trigger: httptrigger, timerTrigger, queue	HTTP site / always a web process
Plan	Consumption (Y1), Flex, Premium EP1, or dedicated	F1/B1/S1... you picked a SKU
Scale to zero	Consumption yes (cold start)	F1 unloads; paid SKUs stay warmer
CD task	AzureFunctionApp@2 appType: functionApp	AzureWebApp@1
Package	Zip of function bits from CI drop	Zip of the web app from the same drop idea

Architecture B — pick the plan for the sleep pattern

Plan	Use when	Bill / ops note
Consumption Y1	Lab HTTP or timer, scale to zero	Pay per execution; cold start; quota can block create
Premium EP1	VNet, pre-warmed, slots	Always a bill. Not a nap
Dedicated plan	You already pay for a serverfarm SKU	Functions as another site on that plan
Skip create	Quota / cost tight today	Read-only: blades + YAML literacy. Honest lab

Architecture C — pitfalls that bill for the nap

Pitfall	What you see	Fix
Timer left on	Cost Management surprise; still firing	Disable the function or delete the app after proof
VS publish + pipeline	Portal shows an older zip than CI	Pipeline is source of truth; stop the right-click publish
Wrong task	AzureWebApp@1 on a functionapp	AzureFunctionApp@2; appType functionApp
Storage missing	Function app create fails (needs a storage account)	Create st<unique> in the same RG; Functions requires it

One-liner to remember

Functions are micro-managers that only wake up when work arrives — and still send you a bill for a timer you forgot.

Step-by-step lab (personal Azure / Azure DevOps only)

Personal subscription + personal Azure DevOps org. RG rg-day33-lab. Consumption default. Read-only is valid if quota is tight.

- 1 az group create -n rg-day33-lab -l centralindia. Create a storage account (Functions requires one) + a Consumption Function App, or stop at the portal error and write the quota note.
- 2 If you create: use a tiny HTTP sample (func init / existing hello). Package a zip in CI — do not treat Visual Studio publish as the source of truth.
- 3 Add AzureFunctionApp@2 with azureSubscription: azure-100-sc, appType: functionApp, appName, package glob on the zip.

- 4 Trigger the HTTP function once (browser or curl). Confirm 200/output. If timer sample: fire once, then disable it.
- 5 Project Settings → confirm the service connection scope. Do not leave a subscription-Owner robot from Day 32 unused on this RG.
- 6 az functionapp delete or az group delete -n rg-day33-lab --yes --no-wait after the proof. Naps still meter.

CLI + AzureFunctionApp@2 — Consumption HTTP sample

```
az group create -n rg-day33-lab -l centralindia
az storage account create -g rg-day33-lab -n stfn<unique> --sku Standard_LRS
az functionapp create -g rg-day33-lab -n func-day33-<unique> \
  --consumption-plan-location centralindia --runtime python --functions-version 4 \
  --storage-account stfn<unique>

# deploy job
- task: AzureFunctionApp@2
  inputs:
    azureSubscription: azure-100-sc
    appType: functionApp
    appName: func-day33-<unique>
    package: $(Pipeline.Workspace)/ci/drop/**/*.*.zip
```

Done checklist

- Can explain Consumption vs Premium without saying 'serverless is free'
- CD uses AzureFunctionApp@2 on a CI zip (or a written quota skip)
- Timer/HTTP not left running overnight
- RG deleted or budget-watched

Tomorrow — Day 34

Deployment slots — staging as a dressing room, warm-up, swap. F1 will refuse; that is data.
