

100 Days of Azure DevOps

Day 40 Handout — Shipping is a pipeline with brakes: artifact, environments, a traffic strategy, a rollback that is not a scavenger hunt

4 - Continuous Delivery · Personal lab only · Educational content · Not a sales pitch

Architecture A — Phase 4 map (Days 31–39)

Day	Object	Keep
31	deployment job + environment	YAML CD, not Classic as source of truth
32–33	AzureWebApp@1 vs AzureFunctionApp@2	Web site vs event + plan that can sleep
34–35	Slots / swap = dressing room / blue-green pointer	F1 has no slots; rollback.md exists anyway
36–37	Canary ramp vs rolling batches	Abort metric; N/N-1 compatibility
38–39	Environment checks + promote drop	Reject works; Prod does not rebuild

Architecture B — definition of done for the mini project

Bar	Pass	Fail
Path	One run Dev → Staging → Prod (prod may echo)	Three unrelated pipelines
Brake	Visible Approval wait + a Reject run saved	YOLO button on prod
Bits	Same drop ID in every deploy log	dotnet/npm/mvn in a deploy stage
Rollback	docs/rollback.md still true	Rollback = 'we will figure it out'

Architecture C — recap failures

Pitfall	What you see	Fix
Classic leftover	A Release still firing on the same app	Disable it. YAML is the street
Prod rebuilt	Ghost from Day 39 still in the run	Not a recap until download: current
S1 left on	Cost Management is the recap	Delete RG or scale to F1 / destroy
No screenshot of the wait	You remember the gate; the post cannot show it	Capture the Approval banner, no secrets

One-liner to remember

Phase 4 recap: shipping is a pipeline with brakes, not a YOLO button — and the bits you promote are the bits you tested.

Step-by-step lab (personal Azure / Azure DevOps only)

Personal Azure DevOps org + personal subscription leftovers only. Project azure-100-labs.

- 1 Run pipelines/multi-env.yml (or equivalent) end to end. Approve prod. Save the run URL.
- 2 Confirm each deploy stage lists the same drop / BuildId. If not, fix YAML before writing the recap.
- 3 Keep docs/rollback.md, canary-plan, and deploy-strategies. Add docs/phase4-recap.md: artifact, env, strategy, brake.
- 4 Delete leftover rg-day32-lab / rg-day33-lab / S1 plans unless you have a written reason. Echo prod is a valid budget choice.
- 5 Screenshot the Approval wait (no variable values). That boring picture is the definition of done.
- 6 Personal learning recap only. No employer story, no client names.

Recap receipt — same drop through the chain

```
# Definition of done (put in docs/phase4-recap.md)
# - Pipeline run <id>: CI published drop
# - Dev downloaded drop (no compile)
# - Staging downloaded drop (no compile)
# - Prod waited on Environment prod Approvals, then downloaded drop
# - Reject run <id> exists from Day 38
# - az group list | leftover lab RGs scheduled for delete
```

Done checklist

- One run with visible approval and logs saved
- Same artifact promoted — no rebuild in CD
- docs/phase4-recap.md written
- Cost leftovers deleted or listed

Tomorrow — Day 41

IaC concepts — declarative vs imperative, idempotency, drift, and picking Bicep or Terraform (one).
