

100 Days of Azure DevOps

Day 76 Handout — Treat red as a signal you own, not décor you scroll past

8 - Monitoring & Observability · Personal lab only · Educational content · Not a sales pitch

Architecture A — where pipeline health actually lives

Surface	What it measures	Where you click
Pipelines → Analytics	Pass rate, duration, failure trend for YAML pipelines	Project → Pipelines → Analytics (or Insights)
Test insights / flakes	Tests that pass and fail on the same commit	Run → Tests tab; flaky test report if enabled
Release / env history	Which environment ate the last failed deploy	Pipelines → Environments → deployments
Job log duration	Which task burned hosted minutes	Run → job → each step elapsed time
Board / work item link	Which change shipped with the red run	Run → Related / work items

Architecture B — decide from a number, not a vibe

Signal	Default action	Escalate when
Failure rate this week	Write the % (or last N runs) in docs/pipeline-health-day76.md	Main red >1 day with no owner comment
Same test fails then passes	Name the flake or delete the test	Team habit is 're-run until green'
CI duration doubled	Open the longest task; cache or split	Feedback >20 min on a personal hello pipeline
Zero runs this week	That is darkness, not 100% success	You are about to quote a fake pass rate
One red run you ignored	Fix it or write why it stays red	You catch yourself saying 'it is always like that'

Architecture C — pitfalls that train you to mute the alarm

Pitfall	What you see	Fix
Costume culture	Main red Mon–Thu; Slack says 'known'	Own the run: fix, quarantine, or document
Flake installment plan	Coin-flip tests; everyone clicks Re-run	Pin the test name; delete or quarantine in YAML
Analytics never opened	Pretty pipeline list, no trend	Project → Pipelines → Analytics once per week
Duration as folklore	'CI is just slow'	Sort tasks by elapsed; the 12-min restore is the product
Employer org screenshot	You almost paste a work failure rate	Personal org only. azure-100-labs project

One-liner to remember

A red pipeline ignored for a week is a culture problem wearing a YAML costume.

Step-by-step lab (personal Azure / Azure DevOps only)

Personal Azure DevOps org only. Project azure-100-labs. No employer pipeline screenshots.

- 1 Project → Pipelines → Analytics (or Insights). If the blade is empty, open the last 10 runs on your busiest YAML pipeline and tally pass/fail by hand.
- 2 Write this week's failure rate (or last-N pass count) in docs/pipeline-health-day76.md. Zero runs = write 'darkness', not 100%.

- 3 Open the newest failed run. Name the failing task and the exception line. If it is a flake, write the test name; do not only click Re-run.
- 4 On a green run, note the three longest tasks and their elapsed times. Duration is hosted minutes plus feedback delay.
- 5 If any pipeline is still red, either fix it in this lab or add a one-sentence owner note in the markdown. Costume off.
- 6 Confirm you are in the personal org (not a work tenant) before any screenshot for the LinkedIn document.

Receipt — last runs you can quote without inventing a pass rate

```
# Azure CLI against the personal org (PAT in AZURE_DEVOPS_EXT_PAT, never committed)
az pipelines runs list --org https://dev.azure.com/<your-org> \
  --project azure-100-labs --pipeline-ids <id> --top 10 -o table
# Then: Pipelines → Analytics. Write pass/fail + longest task in docs/pipeline-health-day76.md
```

Done checklist

- Can say this week's failure rate (or last-N tally) out loud
- Named a flake or wrote 'no flake — real fail' with the task name
- docs/pipeline-health-day76.md exists on the personal repo
- Did not screenshot an employer org
- Posted the LinkedIn document (personal account)

Tomorrow — Day 77

Cost management — Cost Analysis, a tighter budget alert, and deleting leftover lab resource groups
