

100 Days of Azure DevOps

Day 78 Handout — A report card only works if you answer one row

8 - Monitoring & Observability · Personal lab only · Educational content · Not a sales pitch

Architecture A — five pillars vs Advisor categories

WAF pillar	Advisor category you will see	Lab example
Reliability	High Availability / Reliability	Single-region App Service, no backup on a VM disk
Security	Security	Open NSG 22/3389, storage without HTTPS-only, missing Defender
Cost Optimization	Cost	Idle Standard SKU, unattached disk, forgotten Public IP
Operational Excellence	Operational Excellence	No alerts, no activity-log diagnostic, click-ops only
Performance Efficiency	Performance	Wrong SKU for a burst, missing CDN you do not need in a lab

Architecture B — accept or dismiss with a sentence

Recommendation	Default	Honest dismiss
Idle / leftover SKU	Accept → delete or downsize today	'Lab, deleting today' — then delete
Enable diagnostic settings	Accept on the one app you still run	'Resource dies tonight' + destroy
Reserved Instance buy	Dismiss for a personal lab	'No 1-year commit on a learning sub'
Close management ports	Accept if a lab VM is still up	Do not dismiss as 'I know' while 3389 is open
Well-Architected score	Do not post a score you did not run	Pillars in notes beat a fake 92/100

Architecture C — pitfalls that leave homework skipped

Pitfall	What you see	Fix
Dismiss without a note	Recommendation vanishes; disk still bills	Portal → Advisor → dismiss reason, plus markdown
Accept without a change	Green bookmark, same public IP	Accept means you change Azure today
Work-sub Advisor dump	You almost paste a company rec list	Personal subscription only
Pillar as a slogan	'We value security' and an open NSG	Name the pillar you are trading
Fake assessment post	LinkedIn graphic of a score you invented	Five pillars + one real Advisor row

One-liner to remember

Well-Architected is a report card — Advisor is the teacher who already knows you skipped networking homework.

Step-by-step lab (personal Azure / Azure DevOps only)

Personal subscription. Portal Advisor on that sub only. Notes go in azure-100-labs.

- 1 Write the five pillars in docs/advisor-day78.md: Reliability, Security, Cost Optimization, Operational Excellence, Performance Efficiency.
- 2 Portal → Advisor (or az advisor recommendation list). Filter to the personal subscription.
- 3 Pick one recommendation. Copy the category, resource name, and impact into the markdown.
- 4 Either accept it and make the change (delete, close a port, add a diagnostic), or dismiss it with a written why (not 'not now').

- 5 If Advisor is empty (new/empty sub), write that, then run `az advisor recommendation list -o table` as the receipt.
- 6 Do not generate or post a Well-Architected assessment score you did not actually run.

CLI — list Advisor rows you can accept or dismiss honestly

```
az advisor recommendation list -o table
az advisor recommendation list --category Cost --query "[].{impact:extendedProperties,type:shortDescription.problem}" -o json
# Pillars: Reliability | Security | Cost Optimization | Operational Excellence | Performance Efficiency
# One row → accept+change or dismiss+sentence in docs/advisor-day78.md
```

Done checklist

- Five pillars written without a fake numeric score
- One Advisor recommendation accepted with a change or dismissed with a reason
- docs/advisor-day78.md on the personal repo
- Personal subscription only
- Posted the LinkedIn document

Tomorrow — Day 79

Incident management basics — a 2am runbook and a blameless postmortem template
