

100 Days of Azure DevOps

Day 80 Handout — Deploy is not done — observable is done

8 - Monitoring & Observability · Personal lab only · Educational content · Not a sales pitch

Architecture A — Phase 8 stack on one personal app

Piece	Azure object	Proof today
Flashlight	Azure Monitor / metrics on the App Service or Container App	You can see CPU/HTTP without guessing
Camera	Application Insights (microsoft.insights/components)	A request or exception appears after a hit
Scream	Metric alert + Action Group (email to you)	Forced 5xx or availability fail pages you
Storyboard	Azure dashboard or App Insights workbook, 3 tiles	Failure, requests, cost or pipeline health
Culture	Pipeline Analytics + runbook from Days 76/79	Red has an owner; 2am has a page

Architecture B — definition of done

Question	Done	Not done
Can I force a failure I control?	Stop the app / hit a /fail route / kill the slot	Waiting for a 'real' outage
Do I see it in ≤5 minutes?	Insight + alert or dashboard tile updates	Pretty tiles, no signal
Does anyone get a scream?	Action Group email on the personal inbox	Alert rule with no action
Is leftover spend gone?	Day 77 deletes still hold	Dashboard on a cluster you forgot to kill
Can I tell the Phase 8 story?	Monitor, KQL-or-Insights, alert, dashboard, analytics, cost, Advisor, runbook	A screenshot collage with no forced fail

Architecture C — recap pitfalls

Pitfall	What you see	Fix
Green pipeline = done	Users would be in the dark	Observable is the product
Dashboard décor	Three tiles, no alert, no force-fail	Force the fail; watch the scream
Fake MTTR	You post 'we improved MTTR 40%'	Write only what you timed today
Work app instrumentation	You open a company Insights resource	Personal app, personal sub
Runbook missing	You can see the fail and still freeze	Link Day 79 pages from the recap note

One-liner to remember**Phase 8 recap: deploy is not done — observable is done.****Step-by-step lab (personal Azure / Azure DevOps only)**

Personal subscription + personal Azure DevOps org. One leftover lab app is enough. Do not stand up a new estate.

- 1 Pick one deployed lab app (App Service or Container Apps) on the personal sub. Note its resource group in docs/phase8-recap.md.
- 2 Confirm Application Insights is connected (or create one microsoft.insights/components and wire the app).
- 3 Create one metric or log alert + Action Group that emails your personal inbox. Portal → Monitor → Alerts.
- 4 Pin a three-tile dashboard: requests or availability, failures/exceptions, and either cost or pipeline pass rate.
- 5 Force a reversible failure (stop the web app, hit a /fail route, or swap to a broken slot). Start a timer.

- 6 Confirm you can see the failure in Insights/dashboard and/or the alert within five minutes. Write the elapsed time — or write that you could not, and what was missing.
- 7 Link the Day 76 health note, Day 77 deletes, Day 78 Advisor row, and Day 79 runbook. Recap without fake MTTR.

Force a failure you can reverse — then prove the camera and scream

```
az webapp stop -g rg-azure100-lab -n app-azure100-lab
# Timer starts. Watch App Insights live metrics + the alert Action Group.
az monitor metrics alert list -g rg-azure100-lab -o table
az webapp start -g rg-azure100-lab -n app-azure100-lab
# Done = detect within 5 minutes. Write the number you measured, not a slogan.
```

Done checklist

- App Insights + one alert + one dashboard exist on the personal app
- Forced a reversible failure and recorded whether it showed within 5 minutes
- docs/phase8-recap.md links Days 76–79 artifacts
- No invented MTTR percentage
- Leftover paid SKUs still deleted from Day 77

Tomorrow — Day 81

Multi-repo vs monorepo — an ADR for this lab, not a trending blog title
