

100 Days of Azure DevOps

Day 81 Handout — Repo strategy is politics with folders — pick the drama you can afford

9 - Advanced & Enterprise · Personal lab only · Educational content · Not a sales pitch

Architecture A — same product, two folder politics

Dimension	Monorepo	Multi-repo
Atomic change	One PR can move API + pipeline + infra together	Cross-repo PRs and version pins
Ownership	PATH / CODEOWNERS / folder reviews	Repo permissions and separate service connections
CI graph	Path filters or you rebuild the world	Per-repo pipeline; 'which commit is prod' meetings
Templates	templates/ sits next to consumers	Template repo + refs; version lag
This 100-day lab	Default: one repo, many /src samples	Split only for a written lifecycle/access reason

Architecture B — stay or split (no fake clients)

Constraint	Stay monorepo	Split repos when
Shared samples / learning repo	azure-100-labs stays one repo	Never for a blog trend
Different release cadence	Path-filtered pipelines	Library ships weekly; app ships daily and the CI graph hurts
Different access	CODEOWNERS on folders	A secret-producing repo must not be cloneable by the whole org
Published library, many consumers	Still OK if versioned in-tree	External consumers need a versioned package feed
'Enterprise means 10 repos'	Still one repo	Scatter is not a landing zone

Architecture C — pitfalls that look like architecture

Pitfall	What you see	Fix
No path filter	A README typo rebuilds .NET and Node	trigger.paths.include on src/<app>
Repo sprawl	Ten repos, one person, tribal clone lists	ADR: split only on lifecycle or access
Template drift	Each repo has a slightly different Node version	Day 82 templates — one contract
Fake client list	You invent companies that 'would split'	Write constraints, not logos
Work repo map	You diagram an employer org	Personal lab ADR only

One-liner to remember

Repo strategy is politics with folders — pick the drama you can afford.

Step-by-step lab (personal Azure / Azure DevOps only)

Personal Azure Repos or personal GitHub remote. ADR lives in azure-100-labs. No employer repo maps.

- 1 Read your current repo layout (folders, pipelines). You are documenting reality, not a dream org chart.
- 2 Write docs/adr-repo-strategy.md: Decision = this lab stays a monorepo for samples. Status = accepted.
- 3 Add a short 'we would split when' list: different lifecycle, different access, a library consumed as a versioned package. No company names.

- 4 If you have two sample apps, add a path filter on one pipeline so a change under src/a does not build src/b.
- 5 Note the coordination cost you chose: monorepo CI graph vs multi-repo version meetings.
- 6 Commit the ADR. Drama you can afford: one repo, path filters, templates next to consumers.

Path filter — a monorepo that does not rebuild the world

```
trigger:
  branches:
    include: [main]
  paths:
    include:
      - src/demo-shipboard/**
      - templates/**
      - azure-pipelines-shipboard.yml
pr:
  paths:
    include:
      - src/demo-shipboard/**
```

Done checklist

- ADR says the 100-day repo stays monorepo, with split criteria that are constraints not logos
- Path filter exists or you wrote why a single sample does not need one
- No employer repo diagram
- docs/adr-repo-strategy.md committed
- Posted the LinkedIn document

Tomorrow — Day 82

Pipeline templates — extract templates/build.yml so you stop inventing a 15th way to be broken
