

100 Days of Azure DevOps

Day 85 Handout — Insurance is priced — buy it for a constraint, not a slide

9 - Advanced & Enterprise · Personal lab only · Educational content · Not a sales pitch

Architecture A — one pipeline, extra control planes (survey)

Layer	Azure-only (this series)	Hybrid / extra cloud
Build	Azure Pipelines + ubuntu-latest	Still build once; artifact/image is the passport
Identity	Workload identity / service connection to Azure	Second cloud IAM + a second secret envelope
Secrets	Key Vault + variable group	Copied cloud keys = two postcards to lose
Network	Public Microsoft-hosted is enough for labs	Self-hosted pool / VPN / private endpoint for on-prem
Deploy task	AzureWebApp / AzureContainerApps / az	Cloud-specific task only if a real second target exists

Architecture B — when to stay one-cloud-deep

Claimed reason	Default in these 100 days	Real constraint (later)
Diagram looks worldly	Stay Azure-only	Never a reason
'We might need AWS someday'	Stay Azure-only	An actual second estate you already operate
Data residency / existing estate	Write it as a future constraint	Legal or already-running second cloud
On-prem artifact feed	Do not fake a VPN in the lab	Self-hosted agent when a private hop is real
Personal AWS account 'just to try'	Skip unless destroy plan + budget exist	You accept a second bill and will delete tonight

Architecture C — pitfalls that double the blast radius

Pitfall	What you see	Fix
Rebuild per cloud	Two images, two 'latest' tags	Build once; deploy the same digest
Secret photocopy	AWS key in a variable group next to Azure	One vault per cloud; never in YAML
Hosted agent vs on-prem	Job fails on a private IP	That is a Day 22 constraint — not a multi-cloud trophy
Slide-driven lab	You open a second portal to feel senior	One-pager of risks; zero extra deploys
Work multi-cloud map	Employer AWS + Azure diagram	Fictional risks only; personal Azure stays the gym

One-liner to remember

Multi-cloud is insurance and complexity — buy it for a reason, not a slide.

Step-by-step lab (personal Azure / Azure DevOps only)

Survey only. Personal Azure. Do not deploy to AWS/GCP unless you already have a personal account and a destroy plan.

- 1 Write docs/multicloud-risks-day85.md with three sections: secrets, identity, network. Each section gets one real failure mode.
- 2 Write the series rule in that file: one cloud deep for Days 1–100 unless a named constraint appears.
- 3 Sketch 'build once in Azure DevOps → deploy with a cloud-specific task' as a four-box diagram. The artifact is the passport.

- 4 List why a Microsoft-hosted agent cannot see an on-prem feed (Day 22). Hybrid is often a network hop, not a second logo.
- 5 Do not create AWS/GCP resources 'to try' unless the personal account and destroy command are already ready. If you skip, write 'did not deploy'.
- 6 No employer multi-cloud diagram and no invented customer estate.

Pattern note — build once; do not open a second gym membership

```
# Pattern (survey, not a second deploy):  
# 1) Azure Pipelines job on ubuntu-latest builds the image/artifact once  
# 2) PublishPipelineArtifact@1 or docker push to ONE registry  
# 3) Only if a real second cloud exists: a later job uses that cloud's deploy task  
# Prefer one cloud deep in this 100 days.  
pool:  
  vmImage: ubuntu-latest  
steps:  
- script: echo "Build once. Passport is the artifact, not a second portal."  
  displayName: Multi-cloud survey reminder
```

Done checklist

- Risks one-pager covers secrets, identity, and network
- Series rule written: one cloud deep
- Did not open a second cloud 'for the slide' (or destroyed it the same night)
- No employer estate diagram
- Posted the LinkedIn document

Tomorrow — Day 86

Disaster recovery and backup — RPO/RTO as sentences, and a restore that is not fan fiction
