

100 Days of Azure DevOps

Day 87 Handout — City planning for Azure — skip it and resource groups squat

9 - Advanced & Enterprise · Personal lab only · Educational content · Not a sales pitch

Architecture A — CAF pieces (sketch, do not deploy an enterprise)

Piece	Job	What you draw today
Management groups	Policy and RBAC inheritance	Root → Platform → Landing zones → Sandboxes
Platform sub	Identity, connectivity, management	Hub VNet, firewall/DNS box, log sink
Landing zone sub	Workloads	One spoke VNet per app family
Hub-spoke	Shared network path, not a mesh of accidents	Peering lines hub↔spoke only
Azure Policy	Guardrails at the MG, not 200 copies	One assignment note: e.g. allowed locations
Identity	Entra + RBAC from Phase 7	No landing zone is 'just a VNet'

Architecture B — sketch vs stand up

Urge	Do	Do not
Learn CAF	Read the landing zone overview on Microsoft Learn	Deploy enterprise-scale into a personal sub
Need a picture	Paper or docs/landing-zone-day87.md mermaid	Use a real company logo
Policy curiosity	Name one policy at Sandbox MG	Assign production policies to a learning sub
Hub firewall SKU	Draw the box; skip the bill	Buy Azure Firewall Premium for a sketch
'Make it real'	Your existing lab RG is a sandbox spoke in words	Eight subscriptions to look enterprise

Architecture C — shantytown failure modes

Pitfall	What you see	Fix
RG squatters	One sub, 40 RGs, no MG, public IPs everywhere	Sandboxes + a delete policy in the sketch
Policy at the wrong scope	200 identical assignments on RGs	Assign at the management group
Hub as a workload dump	App VMs in the hub	Spokes hold apps; hub holds shared network
Landing zone without identity	Pretty VNets, Owner everywhere	RBAC + Entra on the diagram
Fake corp simulation	Invented employees and savings	Clearly FICTION; no logos, no customers

One-liner to remember

Landing zones are city planning for Azure — skip them and you get shantytowns of resource groups.

Step-by-step lab (personal Azure / Azure DevOps only)

Paper and Microsoft Learn only. Personal notes. Clearly fictional company — no logos, no customers, no employer map.

- 1 Read the Cloud Adoption Framework landing zone overview on Microsoft Learn (enterprise-scale / management groups / hub-spoke).
- 2 Sketch in docs/landing-zone-day87.md: management groups (Platform, Landing zones, Sandboxes), one hub, two spokes.
- 3 Label hub: connectivity, DNS, firewall. Label spokes: workloads. Label sandboxes: personal labs like azure-100.

- 4 Write one policy you would assign at Sandboxes (e.g. allowed locations = your lab region; deny public IP on non-lab).
- 5 Write one sentence: this is FICTION. You are not deploying ALZ Terraform/Bicep into the personal subscription today.
- 6 Optional: az account management-group list -o table on the personal tenant. Empty is a valid receipt.

Sketch checklist — city plan, not a second subscription factory

```
# Hub: shared networking / firewall / DNS
# Spokes: workloads (peer to hub only)
# Management groups + Azure Policy at the right MG
az account management-group list -o table
# If empty: you still have a valid paper landing zone.
# Do not az deployment sub create an enterprise-scale lab tonight.
```

Done checklist

- CAF overview read
- Hub-spoke + MG sketch exists and is labeled FICTION
- One sandbox policy named
- Did not deploy enterprise-scale into the personal sub
- No logos, no employer org chart

Tomorrow — Day 88

GitOps with Flux or Argo CD — Git as desired state, not a kubectl petting zoo
