

100 Days of Azure DevOps

Day 92 Handout — Same public demo, container tuxedo — not a new Netflix clone

10 - Portfolio & Public Launch · Personal lab only · Educational content · Not a sales pitch

Architecture A — package demo-shipboard as an image

Box	Personal Azure object	Pin
Dockerfile	capstone/Dockerfile in the same repo	Non-root user if you can; no secrets in layers
CI build	Docker@2 or docker build in the pipeline	Tag \$(Build.BuildId), not latest-as-truth
Registry	Azure Container Registry Basic (or destroy after)	acr login from the service connection
Runtime default	Container Apps consumption or App Service containers	Same /health contract as Day 91
AKS	Optional only	Destroy the cluster tonight if you create it
GitOps (optional)	Manifest points at the digest	Day 88 rule: no cowboy kubectl

Architecture B — where the tuxedo runs

Constraint	Default	AKS only when
Cost / time box	Container Apps or App Service containers	You will destroy AKS and already know kubectl
Need ingress + scale-to-zero	Container Apps	You want node pools for a portfolio screenshot
Already on zip deploy	Keep the app; change packaging	Do not throw away Day 91 to start microservices
Laptop docker push	Forbidden as the capstone story	Never — the pipeline pushes
Image tag	Build.BuildId or sha digest	latest as the promotion story

Architecture C — tuxedo pitfalls

Pitfall	What you see	Fix
New Netflix clone	Empty repo, new ambition	Same actor as Day 91
latest-as-truth	Staging drifted from the green build	Promote a digest / Build.BuildId
Laptop is CI	docker push from your PC in the README	Pipeline build/push is the story
Forgotten AKS	Cluster bills after the tuxedo photo	Destroy; prefer Container Apps
Secrets in the image	ENV PASSWORD= in Dockerfile	Runtime env / Key Vault; rebuild if it leaked

One-liner to remember

Day 92 is the same app in a container tuxedo — not a new Netflix clone.

Step-by-step lab (personal Azure / Azure DevOps only)

Same capstone/ app as Day 91. Personal ACR + personal runtime. AKS optional and destroyed if used.

- 1 Add capstone/Dockerfile that serves the same /health contract. No secrets in ENV. Build locally only to debug, not to publish.
- 2 Create or reuse a personal ACR. Note the login server in capstone/README.md.
- 3 Extend the pipeline: docker build, tag \$(Build.BuildId), docker push to ACR. Service connection does the auth.
- 4 Deploy that image to Container Apps or App Service for containers. Confirm /health shows the new build id.

- 5 Update the README diagram with Registry + runtime boxes. Five-minute demo still has to work.
- 6 If you opened AKS, write the destroy command in the README and run it when the screenshot exists.
- 7 Do not start a new streaming-platform repo.

Pipeline fragment — build/push the same app, pin the tag

```
- task: Docker@2
  displayName: Build and push demo-shipboard
  inputs:
    command: buildAndPush
    repository: demo-shipboard
    dockerfile: capstone/Dockerfile
    containerRegistry: acr-azure100-lab
    tags: |
      $(Build.BuildId)
# Runtime: Container Apps / App Service containers pull that tag.
# AKS optional. Destroy it. Never latest-as-truth.
```

Done checklist

- Dockerfile in the same capstone repo
- Pipeline builds and pushes to personal ACR with Build.BuildId
- Same app URL/contract as Day 91, now from a container
- AKS destroyed if you created it; latest is not the promotion story
- README diagram includes registry + runtime

Tomorrow — Day 93

Capstone 3 — IaC for two environments of the same public demo, then destroy non-prod
