

100 Days of Azure DevOps

Day 94 Handout — Pinned repos with vague names are closed blinds

10 - Portfolio & Public Launch · Personal lab only · Educational content · Not a sales pitch

Architecture A — shop window for the public demo

Pane	What goes on personal GitHub	What never ships
Repo	Sanitized capstone + selected 100-day samples	Work tenant URLs, internal project names
README	Problem, Architecture, Pipelines, Security, Cost, License	Empty README or 'test' / 'new-folder'
Diagram	The four/six boxes from Days 91–93	Employer network diagrams
How to run	Commands you clicked through as a stranger	Steps that require a secret you did not document as a placeholder
Pins	Capstone first; one or two supporting repos	Graveyard forks and untitled gists
License	MIT or another license you mean	Default leftover with no LICENSE

Architecture B — sanitize on the way out

Item	Publish	Strip
Pipeline YAML	Yes — ubuntu-latest, template calls, artifact names	Service connection names that leak a tenant
Screenshots	Green run + /health with a fake build id	Email addresses, coworker faces, work boards
Cost notes	SKU + 'deleted after' — honesty	Invented savings percentages
Secrets	Placeholder KEY_VAULT_NAME in docs	Any real secret, PAT, or connection string
Commit history	New repo or rewritten public history	Accidental .env from an old commit

Architecture C — closed-blind failure modes

Pitfall	What you see	Fix
Vague pin	Repos named test, new-folder, final2	Rename or write a description that works without the name
README theater	Badges, no how-to-run	Click your own steps once as a stranger
Secret in Git	KV value or PAT in history	Rotate; purge if needed; treat as Day 97's incident
Unsanitized lift	Internal hostnames in a screenshot	Crop or retake on the personal app
Pin the graveyard	12 forks, 0 capstone	Pin what a stranger should open first

One-liner to remember

GitHub is your shop window — pinned repos with vague names are closed blinds.

Step-by-step lab (personal Azure / Azure DevOps only)

Personal GitHub account, personal time, sanitized capstone only. No employer content, no work tenant names.

- 1 Create or update a personal GitHub repo for the capstone. If history might contain secrets, start a clean public repo and copy sanitized files.
- 2 Write README sections: Problem | Architecture | Pipelines | Security | Cost notes | License | How to run.
- 3 Grep the tree for passwords, PATs, tenant IDs, and work hostnames. Remove them. Rotate anything that already leaked.

- 4 Add screenshots that show /health and a green pipeline with no email, no coworker, no work board.
- 5 Click through How to run once as if you were a stranger. If you get stuck, the README is wrong — fix it.
- 6 Pin the capstone on your personal GitHub profile. Unpin vague test repos or give them descriptions.
- 7 Cost note: SKUs used and what you already destroyed. No invented savings.

README skeleton — the demo when you are not in the room

```
# demo-shipboard

## Problem
Public Azure DevOps CI/CD demo: one service, /health, env promotion.

## Architecture
Repo → Pipeline (ubuntu-latest) → Artifact/image $(Build.BuildId) → App Service or Container Apps

## Pipelines
See azure-pipelines.yml and pipelines/infra.yml. Promote the same artifact.

## Security
No secrets in Git. Key Vault name is a placeholder. Service connections stay in Azure DevOps.

## Cost notes
F1 / Basic ACR / deleted after screenshots. No invented savings.

## License
MIT
```

Done checklist

- Sanitized capstone is on personal GitHub
- README has Problem, Architecture, Pipelines, Security, Cost, License, How to run
- You followed How to run once as a stranger
- No secrets, no employer screenshots
- Capstone is pinned; vague repos are unpinned or described

Tomorrow — Day 95

Personal site or blog — translate the YAML into a story a non-terminal human can trust
