

100 Days of Azure DevOps

Day 95 Handout — Translate YAML into a story a non-terminal human can trust

10 - Portfolio & Public Launch · Personal lab only · Educational content · Not a sales pitch

Architecture A — one public write-up, one repo

Layer	Job	Keep it personal
Title	How I built a small Azure DevOps CI/CD demo in public	Not a cert you do not have; not a client you do not have
Story	Problem, approach, what you would do differently	Not 400 lines of YAML pasted into HTML
Evidence	Link the GitHub repo + 1–2 screenshots	YAML stays in Git
Host	GitHub Pages or one Dev.to article	Two platforms with half a draft is not a case study
Audience	A human who may never open azure-pipelines.yml first	Not a prospecting list

Architecture B — Pages vs a post

Constraint	Default	Skip
Want a URL you control	GitHub Pages from the capstone docs/ or a /site folder	A custom domain you will not renew
Want distribution	One Dev.to (or equivalent) article linking the repo	Cross-posting three half-edits
No time for a theme	A single markdown page is enough	A blog engine rewrite on Day 95
Employer case itching	Do not write it	Internal diagrams, 'at my company we...'
Traffic theater	Do not invent readers or customers	Fake '10k users' on a hello /health

Architecture C — trust-breaking pitfalls

Pitfall	What you see	Fix
YAML dump	Readers bounce; no story	Prose first; link the file
Employer leak	Workplace identifiable detail	Delete; rewrite as the public demo only
Cert flex unpaid	'AZ-400 certified' before it is true	Day 96 is review, not a credential
Half two sites	Pages stub + Dev.to stub	Finish one
Theater metrics	Invented traffic or 'clients'	Describe labs you actually ran

One-liner to remember

A case study translates YAML into a story a non-terminal human can trust.

Step-by-step lab (personal Azure / Azure DevOps only)

Personal GitHub Pages or a personal Dev.to (or similar) article. Capstone demo only. No employer content.

- 1 Draft the case study in capstone/docs/case-study.md (or /site): Problem, approach, brakes on the pipeline, image tag, Key Vault, what you would change.
- 2 Title it about the public CI/CD demo — not a client case and not a certification you have not earned.
- 3 Link the GitHub repo. Paste at most a short YAML fragment; the rest stays in Git.
- 4 Publish via GitHub Pages (Settings → Pages) or one Dev.to article. If the host is not live today, the draft must be complete enough to paste tomorrow.

- 5 Read the piece once as if you do not know YAML. If a step is missing, add it.
- 6 Strip any workplace detail. This series stays a classroom, not a case-study of an employer.

Article outline — story then evidence

```
# How I built a small Azure DevOps CI/CD demo in public

1. Problem: I wanted a demo I can walk in five minutes.
2. Approach: one service, tests, artifact, env promotion, then a container + IaC.
3. Brakes: approvals, Key Vault, pin Build.BuildId, destroy non-prod.
4. Evidence: https://github.com/<you>/demo-shipboard
5. What I would do differently next time.
# Host: GitHub Pages or one Dev.to post. YAML stays in Git.
```

Done checklist

- One complete write-up that links the repo
- No employer content, no fake traffic, no unearned cert claim
- Published or ready-to-paste tomorrow
- YAML is evidence, not the article body
- Posted the LinkedIn document

Tomorrow — Day 96

AZ-400 review — map these 100 days to the skills outline and write a gap list, not a hero cram
