

100 Days of Azure DevOps

Day 9 Handout — Feeds, upstream caching & package promotion

Learning in public · Personal lab only · Educational content · Not a sales pitch

Architecture A — artifacts building blocks

Artifacts Component	What it provides	Typical use case
Feed	Organizational or project-scoped package registry	Internal shared libraries & utilities
Upstream Sources	Proxy + cache for public registries (nuget, npm)	Build resilience when public registries fail
Feed Views	Promotion channels (@local, @prerelease, @release)	Release gating without re-tagging versions
Retention Policy	Auto-clean rules for older package versions	Storage cost control and decluttering

Architecture B — supported ecosystems & client setup

Package Ecosystem	Config File	Auth / Publish Tool
npm / Node.js	.npmrc (registry + always-auth)	vsts-npm-auth / npm publish
NuGet / .NET	nuget.config (packageSources)	dotnet nuget push / Azure DevOps task
Python (pip/twine)	pip.ini / .pypirc	twine upload --repository-url
Universal Packages	Pipeline Task / az artifacts	az artifacts universal publish

One-liner to remember

Pipelines cook the software · Artifacts is the pantry · Upstream caching ensures you never starve when public repos blip

Step-by-step lab (20–30 min)

In **azure-100-labs** (Azure Artifacts is included for up to 2GB free storage):

- 1 Navigate to **Artifacts** hub in your project
- 2 Click **Create Feed** → Name: **day09-packages**
- 3 Set visibility to **Project: azure-100-labs** (project-scoped)
- 4 Check **Include packages from common public sources** (nuget.org, npmjs)
- 5 Open **Feed settings** → inspect default views: **@local**, **@prerelease**, **@release**
- 6 Click **Connect to feed** → select npm / NuGet → review the auth config snippet
- 7 Save the feed URL in your notes — you will consume it in Phase 3 CI/CD pipelines

Client config snippet example

```
# .npmrc
registry=https://pkgs.dev.azure.com/<your-org>/azure-100-labs/_packaging/day09-packages/npm/registry/
always-auth=true
# Auth CLI helper: npx vsts-npm-auth -config .npmrc
```

Done checklist

- I can explain Feeds vs Upstream Sources vs Views
- Feed day09-packages created in azure-100-labs
- Upstream sources enabled for public packages
- Client config snippet (.npmrc / nuget.config) saved

Tomorrow — Day 10

Phase 1 Capstone Mini Project & Recap — tying Boards, Repos, Test Plans, and Artifacts together.
